

Aqua Crystal

With the installation of a new aquarium a turbidity can appear which can be due to a non biological function of a filter, unclean decoration, algae, un pure water, or upcoming soil while filling the water.

While using Aqua-Crystal water will turn crystal clear within a very short time, small particles are blocked and they sink to the bottom of the aquarium. Aqua-Crystal also removes phosphates, diluted copper and supports filter in his biological function.

USAGE

Add 25 drops per 50 liters in the aquarium, as close as possible in the presence of the outlet of a functioning filter to assure a good repartition of Aqua-Crystal. The flocculation procedure starts immediately, and in most cases the aquarium water is clear within a few hours. The function of Aqua-Crystal will strongly be improved, while stopping the function of the filter for a couple of hours.

After the flocculation process we advise to aspirate with a tube and thus remove the precipitation parts, and then start the filter. If the flocculated precipitation not has been aspirated, clean the filter materials within a couple of days. The treatment can be repeated with half a dose after 24 hours.

WARNING

The KH could drop through due to flocculation process. In this case we advise the use of KH+ from Aquatic Nature to re-install the wanted value.

To assure a good function the pH level should be 7 up to 7,5.

The KH value may not be under 4° KH while using Aqua-Crystal, the control of the KH value is easy to be done with Indicator Test 5N1 from Aquatic Nature.

To re-establish the biological balance in the aquarium we advise the use of **Bio-Bacter 2 in 1** from Aquatic Nature.
